Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in this application:

Listing of Claims:

5

Claim 1 (Currently Amended): A personal data assistant (PDA) connected to a server
via a network, the server having a plurality of application programs, the PDA
comprising:
a housing;

10   a memory installed in the housing for storing programs and data;
a processor electrically connected to the memory for executing the programs
stored in the memory;
a display panel installed on the housing for displaying data; and
an input device for inputting data;

15   wherein the PDA is capable of sending [[a]] an original file to the server via the
network, the server then opening the original file using a corresponding
application program and sending images generated by the opened original file
back to the PDA.

20 Claim 2 (Currently Amended): The PDA of claim 1 wherein the PDA and the server
each comprise a data transceiving module, the original file being sent from the
data transceiving module of the PDA to the data transceiving module of the server
so that the server is capable of opening the original file.

25 Claim 3 (Currently Amended): The PDA of claim 2 wherein when the server opens the
original file, the server will transmit the images generated by the opened original
file via the data transceiving module of the server to the data transceiving module
of the PDA so that the display panel is capable of displaying the images generated
by the opened original file.

30

2

Claim 4 (Currently Amended): The PDA of claim 3 wherein when the server opens the original file, a user is capable of using the input device to enter a user instruction, the user instruction being transmitted from the data transceiving module of the PDA to the data transceiving module of the server so that the server is capable of

5   executing the user instruction, and then the server transmitting new images generated by the opened original file generated by executing the user instruction to the data transceiving module of the PDA from the data transceiving module of the server so that the display panel is capable of displaying the new images generated by the opened original file.

10

Claim 5 (Currently Amended): The PDA of claim 2 wherein a user is capable of using the input device to enter a file back instruction, the file back instruction being transmitted from the data transceiving module of the PDA to the data transceiving module of the server, when receiving the file back instruction, the server

15   transmitting the original file back to the PDA via the data transceiving module of the server back and the data transceiving module of the PDA.

Claim 6 (Currently Amended): The PDA of claim 2 wherein a user is capable of using the input device to enter a file close instruction, the file close instruction being

20   transmitted from the data transceiving module of the PDA to the data transceiving module of the server so as to make the server close the original file.

Claim 7 (Previously Presented): The PDA of claim 1 wherein the network is an Internet.

25

Claim 8 (Original): The PDA of claim 1 wherein the memory is a flash memory.

Claim 9 (Currently Amended): The PDA of claim 1 wherein by using the input device, the images generated by the opened original file can be edited on the display

30   panel.

Claim 10 (Currently Amended): A method of file editing using a PDA, the method

3

comprising:

connecting the PDA to a server via a network;

uploading [[a]] an original file from the PDA to the server;

the server opening the original file utilizing an appropriate application software

5   stored on the server;

displaying images generated by the opened original file transmitted from the

server to the PDA on a display panel of the PDA;

editing the original file on the display panel utilizing a user input device

comprised by of the PDA;

10   closing the original file; and

downloading the original file from the server to the PDA.

Claim 11 (Currently Amended): The method of claim 10 wherein the PDA and the

server each comprise a data transceiving module, the original file being sent from

15   the data transceiving module of the PDA to the data transceiving module of the

server so that the server is capable of opening the original file.

Claim 12 (Currently Amended): The method of claim 11 further comprising the server

transmitting the images generated by the opened original file via the data

20   transceiving module of the server to the data transceiving module of the PDA so

that the display panel is capable of displaying the images generated by the opened

original file.

Claim 13 (Currently Amended): The method of claim 12 wherein when the server

25   opens the original file, a user is capable of using the input device to enter a user

instruction, the user instruction being transmitted from the data transceiving

module of the PDA to the data transceiving module of the server so that the server

is capable of executing the user instruction, and then the server transmitting new

images generated by the opened original file generated by execution of the user

30   instruction to the data transceiving module of the PDA from the data transceiving

module of the server so that the display panel is capable of displaying the new

images generated by the opened original file.

4

Claim 14 (Previously Presented): The method of claim 13 wherein the user instruction is a file editing command.

5　Claim 15 (Currently Amended): The method of claim 11 further comprising the server transmitting the <u>original</u> file back to the PDA via the data transceiving module of the server and the data transceiving module of the PDA upon reception of a file back instruction wherein a user is capable of using the input device to enter the file back instruction, the file back instruction being transmitted from the data

10　transceiving module of the PDA to the data transceiving module of the server.

Claim 16 (Currently Amended): The method of claim 11 further comprising the server closing the <u>original</u> file upon reception of a file close instruction, wherein a user is capable of using the input device to enter the file close instruction, the file close

15　instruction being transmitted from the data transceiving module of the PDA to the data transceiving module of the server.

Claim 17 (Previously Presented): The method of claim 10 wherein the network is the Internet.

20

Claim 18 (New): A method of file editing using a PDA, the method comprising:

connecting the PDA to a server via a network;

uploading an original file from the PDA to the server;

the server opening the original file utilizing an appropriate application software

25　stored on the server;

transmitting images generated from opening the original file with the application software on the server to the PDA and remotely displaying the images on a display panel of the PDA;

remotely editing the original file stored on the server via the display panel of the

30　PDA utilizing a user input device of the PDA;

closing the original file stored on the server; and

downloading the original file from the server back to the PDA.

5

Claim 19 (New): The method of claim 18 wherein remotely editing the original file
stored on the server via the display panel of the PDA utilizing the user input
device of the PDA comprises:

5   using the user input device to enter a user instruction;

transmitting the user instruction from the PDA to the server;

executing the user instruction on the server;

transmitting new images generated by execution of the user instruction on the
opened original file to the PDA; and

10   displaying the new images on the display panel of the PDA
